Unlocking DeFi Yield: Core Assets Strategy

Leveraging BTC, ETH, & SOL for Maximum Returns

Discover how foundational cryptocurrencies drive decentralised finance strategies.

Why BTC, ETH & SOL Form the Foundation

Highest Liquidity & Volume

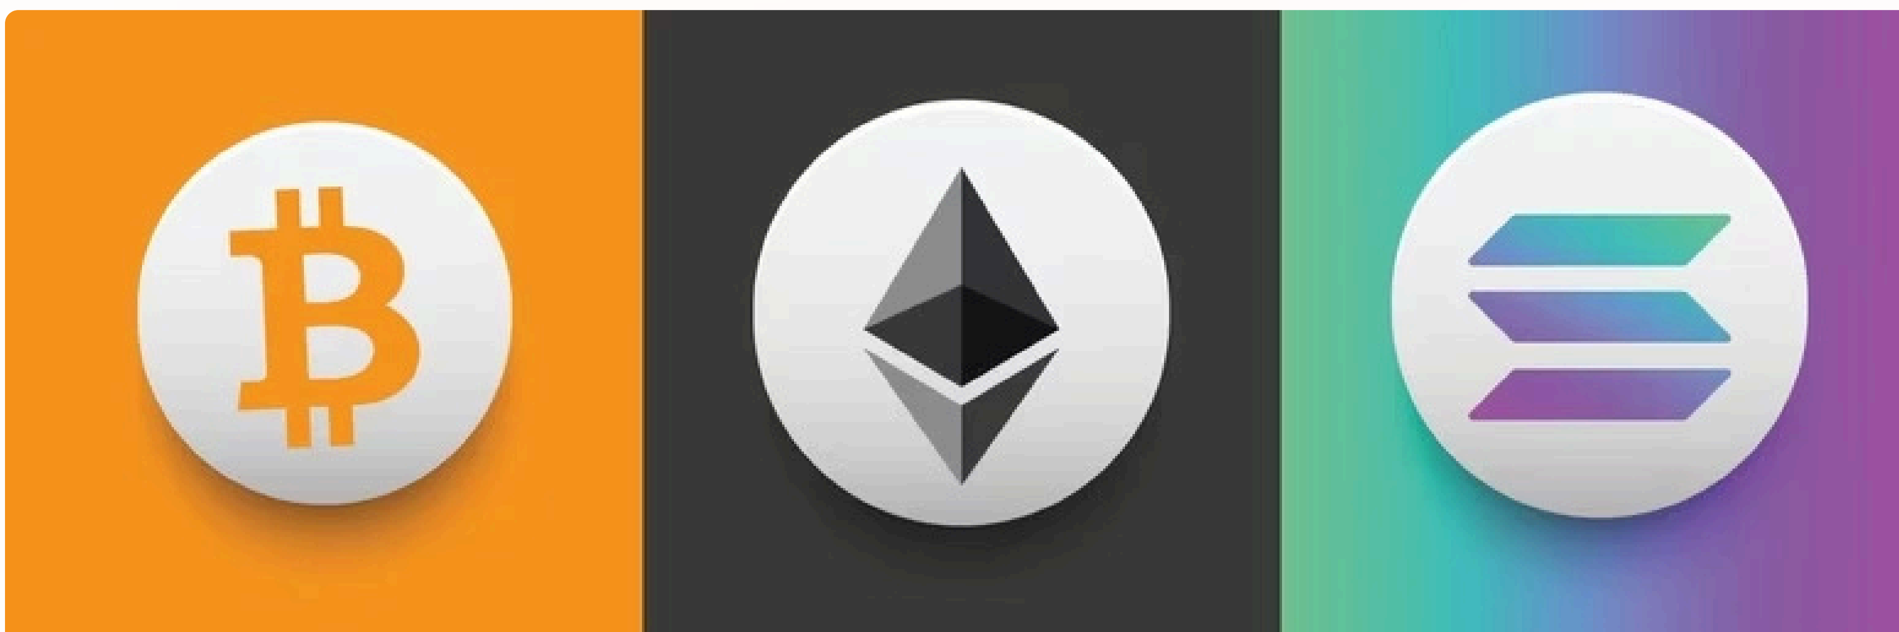
These three cryptocurrencies dominate trading activity and total value locked (TVL) across the entire DeFi ecosystem, ensuring high market efficiency and consistent demand.

Proven Predictability

With the longest track records among major crypto assets, BTC, ETH, and SOL offer a degree of historical predictability, making them reliable cornerstones for investment.

Universal Adoption

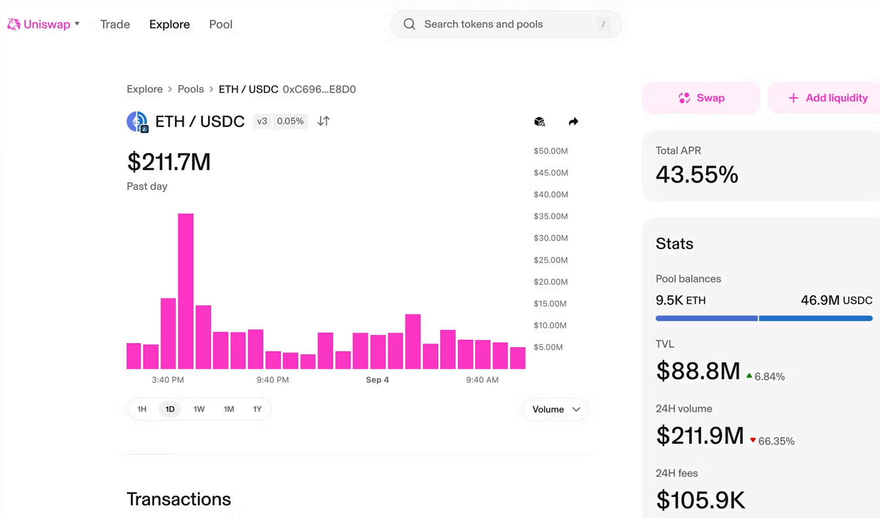
Accepted across virtually every decentralised finance protocol and exchange, they provide unparalleled interoperability and access to a wide array of yield-generating opportunities.



DeFi Yield Strategies: Practical Applications

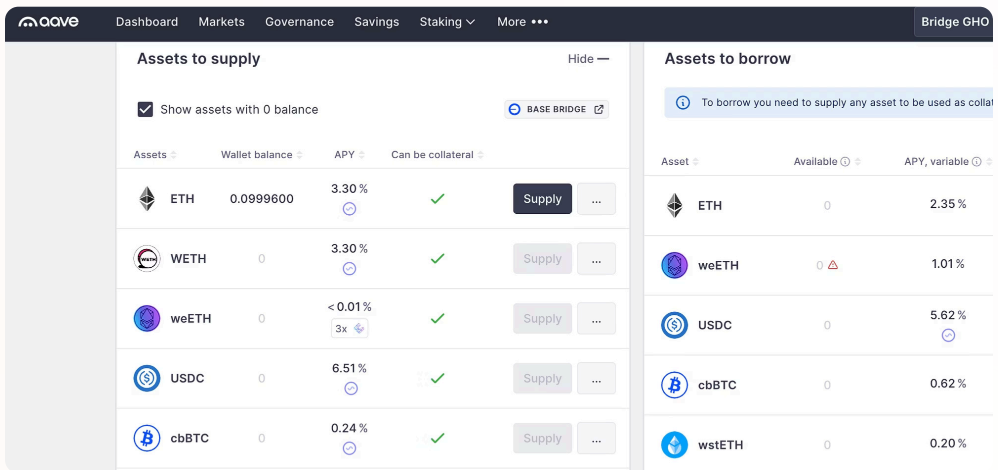
Liquidity Provision

Pair BTC, ETH, or SOL with stablecoins (e.g., ETH/USDC, SOL/USDT) in decentralised exchanges (Uniswap). Earn substantial fees from swaps and potential additional incentives from protocols. Anticipate APYs ranging from 40-80%, subject to market conditions and pool specificities. + it gives you exposure in assets with proven high return potential



Collateral for Lending Markets

These prime assets are universally accepted across leading DeFi lending protocols like Aave and Compound. Deposit your ETH, SOL, or wBTC from (2-8% APY) and borrow stablecoins (2-6% APY), allowing you to maintain exposure to your core assets while freeing up capital for more defi strategies . This strategy offers flexibility and capital efficiency.



All these strategies will be demonstrated step by step in the upcoming modules.

Staking: What It Is & Why It Matters

Proof of Stake Mechanism

In Proof of Stake (PoS) blockchains, network validators secure the network by "locking" or pledging their tokens. This process validates transactions and creates new blocks.

Earn Validation Rewards

In return for their critical role in securing the network, validators receive newly minted tokens and transaction fees. These rewards are then shared with those who delegate their tokens to them (stakers).

Passive Yield Generation

For holders, staking offers a low-effort way to earn a passive income. Typically, stakers can anticipate an annual yield of 3-7% in native tokens (ETH or in SOL), simply by supporting network operations.

Hold & Earn

The primary benefit is generating yield while retaining ownership and exposure to your core assets, aligning long-term holding with active participation in the network's security.

ETH & SOL Staking Opportunities

ETH Staking via Lido

(https://lido.fi/)

Lido is the biggest ETH staking app, with TVL of 38 B $ and audited by the biggest and most reliable companies.

Stake your ETH through platforms like Lido and receive stETH (liquid staking token) in return. This allows you to earn approximately 3-5% in ETH staking rewards while maintaining liquidity. Then, stETH can be deployed in other DeFi protocols (e.g., Aave, Curve) to "stack" multiple layers of yield, amplifying returns.

SOL Staking

(https://www.jito.network/)

Jito is the biggest SOL stacking app, with TVL of 3 B $. Like Lido, but for SOL

Stake your SOL natively or use liquid staking protocols such as Jito to receive jitoSOL. Typical yields range from 6-8% APR. The Solana ecosystem often provides additional incentives for integrating jitoSOL liquid staking tokens within its DeFi ecosystem, by giving more farming insentives.

Wrapped Assets: Bridging Chains

wBTC: Bitcoin on Ethereum

wBTC (Wrapped Bitcoin) is an ERC-20 token that represents Bitcoin on the Ethereum blockchain. It is 1:1 backed by actual BTC, held in secure reserves, enabling Bitcoin's value to be used within Ethereum's vast DeFi ecosystem.

wETH: Wrapped Ethereum

wETH (Wrapped Ethereum) is an ERC-20 compliant version of Ether. While ETH itself isn't fully ERC-20 compatible, wETH facilitates its use across many DeFi protocols and decentralised exchanges that require the ERC-20 standard for token interoperability.

Cross-Chain Utility

The primary purpose of wrapped assets is to enable non-native cryptocurrencies to operate across different blockchain networks. This interoperability significantly expands the utility and yield-generating possibilities for assets like BTC within diverse DeFi environments.

Wrapped assets make it easier to use core assets across different blockchains.
